Intervention / Comparator Agent	Type		Name	Details
	Intervention		NIL	NIL
	Comparator Agent		NIL	NIL
Inclusion Criteria	Age From	18.00 Year(s)		
	Age To	99.00 Year(s)		
	Gender	Both		
	Details	1. All patients undergoing bone marrow aspiration or biopsy procedure in the oncology departments		
ExclusionCriteria	Details			
Method of Generating Random Sequence				
Method of Concealment				
Blinding/Masking				
Primary Outcome	Outcome		TimePoints	
	Pain experienced by the patient as per numerical analog scale		Immediately after bone marrow procedure	
Secondary Outcome	Outcome		TimePoints	
	Factors associated with pain		After the procedure	
Target Sample Size	Total Sample Size="93" Sample Size from India="93" Final Enrollment numbers achieved (Total)= "Applicable only for Completed/Terminated trials" Final Enrollment numbers achieved (India)= "Applicable only for Completed/Terminated trials"			
Phase of Trial	N/A			
Date of First Enrollment (India)	05/01/2024			
Date of Study Completion (India)	Applicable only for Completed/Terminated trials			
Date of First Enrollment (Global)	Date Missing			
Date of Study Completion (Global)	Applicable only for Completed/Terminated trials			
Estimated Duration of Trial	Years="1" Months="0" Days="0"			

Recruitment Status of Trial (Global) Modification(s)	Not Applicable
Recruitment Status of Trial (India)	Open to Recruitment
Publication Details	N/A
Individual Participant Data (IPD) Sharing Statement	Will individual participant data (IPD) be shared publicly (including data dictionaries)? Response - NO
Brief Summary	Bone marrow procedure is an extremely painful procedure essential for the diagnosis and management of several hematological malignancies. Studies have attempted to quantify patient pain during the bone marrow procedure and identify the factors associated with pain. (1,2) There are several factors associated with pain during the bone marrow aspiration and biopsy procedure including <i>patient related factors</i> body habitus and bone density, anxiety level, pre-existing knowledge of the procedure, prior patient experience; <i>operator related</i> factors like experience and skill and <i>procedure related</i> like the mode of anaesthetic and other medications and the site of aspiration.(1&4) There are many strategies to reduce the pain during the procedure (1,3,5,6) however many are not feasible in a Low- and Middle- Income countries(LMICs). India and other LMICs have a distinctly unique pattern of oncological care, with a high case burden per oncologist and access issues for patients including long travel and waiting to access cancer care.(7) These factors taken together with the overall pain of the procedure itself may cause the patient to have significant distress during bone marrow procedure. In many conditions like multiple myeloma, patient may have preexisting bone lesions and bony pains, and need for repeated bone marrow examination for disease evaluation. There is a dearth of data from India regarding the patient experience during bone marrow procedure in oncology patients. There is also no data or formal analysis of the factors associated with pain in patients undergoing procedures. Also, there are very few standardized questionnaires for assessing acute procedural pain or the pain sensitivity in Indian patients. (8&10) Hence we undertook this study to assess the pain and factors associated with pain in patients undergoing bone marrow evaluation in the oncology department.
