CTRI Number	CTRI/2020/01/022994 [Registered on: 27/01/2020] Trial Registered Prospectively															
Last Modified On:	03/01/2020															
Post Graduate Thesis	Yes															
Type of Trial	Observational															
Type of Study	Cross Sectional Study															
Study Design	Single Arm Study															
Public Title of Study	Comparison of neuropathy scoring system and Biothesiometry															
Scientific Title of Study	Comparative Study of Neuropathy Scoring System with Biothesiometry for Detection of Diabetic Neuropathy															
Trial Acronym

Brief Summary	According to the IDF Atlas of Diabetes in 2017 about 72.9 million people in India were living with diabetes. Diabetes is associated with various microvascular complications like neuropathy, nephropathy and retinopathy. The most common among these is neuropathy. The most common presentation of Diabetic Peripheral Neuropathy (DPN) is distal symmetric polyneuropathy resulting from small and large fibre dysfunction leading to loss of sensory proprioception, temperature and pain along with symptoms of numbness , tingling , burning and sometimes shooting pain also. The early recognition and appropriate management of neuropathy in patients with diabetes is important because a number of treatment options exists for early symptomatic diabetic neuropathy which can improve the quality of life, also upto 50% of DPN may be asymptomatic , if they not recognised in time it may lead to development of foot ulcers and related complications. the Michigan Neuropathy Screening Instrument (MNSI) is an outpatient programme which includes a brief 15 item questionnaire and a lower extremity examination . The MNSI has been validated for detection of neuropathy in the DCCT trial. The questionnaire has a total score of 15 and a score of 7 or above is abnormal and for examination total score is 8 and a score of 2.5 and above is abnormal. Biothesiometer is a hand held instrument which measures the vibration perception threshold . this is measured at the level of the base of great toe . Since there are few studies which have validated the MNSI in the Indian patients this study is being done with the aim of performing the Biothesiometry and administering the MNSI to patients of Type 2 diabets and comparing the results of the two methods for detecting DPN.
