CTRI Number	CTRI/2008/091/000276 [Registered on: 12/12/2008]															
Last Modified On:	19/03/2013															
Post Graduate Thesis	No															
Type of Trial	Interventional															
Type of Study Modification(s)	Drug															
Study Design	Randomized, Parallel Group, Placebo Controlled Trial															
Public Title of Study Modification(s)	A clinical trial to study the blood sugar lowering effects and safety of oral insulin in patients with type 2 Diabetes Mellitus.															
Scientific Title of Study Modification(s)	A Multicenter, Randomized, Double-Blind, Placebo Control Study of IN-105 tablets [oral insulin] in Patients with Type 2 Diabetes Mellitus who have inadequate Glycemic Control on Optimal doses of Extended Release Metformin Tablets.															
Trial Acronym

Health Condition / Problems Studied Modification(s)	Health Type		Condition
	Patients		Type 2 Diabetes mellitus ,
Intervention / Comparator Agent Modification(s)	Type	Name	Details
	Intervention	IN-105	4 Doses. Participation in the study was upto a maximum of 29 weeks
	Comparator Agent	Placebo	4 Doses. Participation in the study was upto a maximum of 29 weeks
Inclusion Criteria Modification(s)	Age From	30.00 Year(s)	
	Age To	65.00 Year(s)	
	Gender	Both	
	Details	Patients of either sex with established diagnosis of type 2 diabetes mellitus as per revised WHO criteria for at least 24 weeks. Age - 30 to 65 years. Fasting Plasma C-peptide >0.6 ng/ml at screening. Body Mass Index (BMI) 18 to 29.9 kg/m2. Willingness to provide written informed consent to participate in the study. Glycosylated haemoglobin (HbA1c) concentrations of >7.5% and & â%œ 10%. Currently on stable dose of Metformin Extended-Release Tablets at doses ranging between 1 to 2 gm per day for at least 12 weeks prior to the screening visit. Willingness to fulfil the study requirements for the entire duration of the study.	
ExclusionCriteria	Details	History of hypersensitivity to the study drugs or to drugs with a similar chemical structure. History of severe or multiple allergies. Patients currently on other oral hypoglycemic agents other than extended release metformin or any alternative forms of medications known to affect the glycemic parameters. Type 1 diabetes mellitus. Fasting venous plasma glucose >200 mg/dl on two consecutive occasions at screening. Two or more severe hypoglycaemic episodes requiring hospitalization or intravenous glucose or treatment with glucagon in the past 6 months. Any hospitalization or emergency room visit due to poor diabetic control within the past 6 months. Complications of diabetes mellitus including a history or finding of moderate to severe Non Proliferative Diabetic Retinopathy or Proliferative Diabetic retinopathy of any severity, proteinuria >2+ by urine dipstick, serum creatinine of >1.8 mg/dl for males or >1.5 mg/dl for females, history of renal transplant, severe peripheral vascular disease which has resulted in amputation, chronic foot ulcer, claudication or absent pulses, history of autonomic neuropathy. Current significant cardiovascular, respiratory, gastrointestinal, hepatic, renal, neurological, psychiatric and/or hematological disease as evaluated by the Investigator except patients diagnosed with essential hypertension and/or hyperlipidemia if well controlled on	

	stable doses of antihypertensive and/or hypolipidemic drugs for at least 3 months prior to the screening visit. Impaired hepatic function as shown by an increased Alanine aminotransferase (ALT) and/or Aspartate aminotransferase (AST) greater than three times the upper limit of normal range and/or Bilirubin greater than 1.5 times the upper limit of normal range at study entry. History of cancer in the last 5 years. Any condition which requires administration of systemic corticosteroid in the last 2 weeks prior to screening or any condition which requires chronic treatment with systemic corticosteroids. Pregnancy, lactation, or planned pregnancy during the study duration. Women of childbearing potential (any women who is not surgically sterile or > 2 years post menopause) must give consent for using a reliable method of contraception (e.g. double-barrier, tubal ligation or stable hormonal contraception) throughout the study period. Women who become pregnant during the study must be discontinued from the study, but followed for pregnancy outcome. Blood donation within the last 30 days. Treatment by another investigational agent during the 3 months prior to inclusion in the trial. Current or past treatment with insulin or insulin analogues to control diabetes. Hepatitis B, hepatitis C and/or HIV positive patients. Current drug or alcohol abuse, or a history which in the opinion of the Investigator will impair patient safety or protocol compliance.

Recruitment Status of Trial (India)	Completed
Publication Details Modification(s)	IN105 was noted to have immediate benefits in glucose level control in T2DM patients. however this was not translating to HbA1C improvement. Selective benefit of 10mg possibly due to translation of short term glucose control to HbA1C improvement in patients with well controlled fasting sugar levels are noted. mimicking natural insulin delivery is a benefit since it can translate in patients to negligible systemic effect and insulin sparing effect. There was no hypoglycemia, immunogenicity or other AE concerns other than the expectations from any other approved insulin formulations.
Individual Participant Data (IPD) Sharing Statement	Will individual participant data (IPD) be shared publicly (including data dictionaries)?
Brief Summary Modification(s)	The study was planned to assess the safety and efficacy of post prandial oral insulin on diabetes control in patients with T2DM. significant difference in mean 1 hour post standard test meal postprandial glucose at 14 and 24 weeks was noted. C-peptide levels at 1 hour and at 2 hours after standard test meal showed significant differences. The study did not show difference in HbA1C. there were no safety concerns.
